

Return proportion per round, by family

Mixed dyads (solid) vs the same family among its own kind (dashed) · Informed negative-only noise · No defectors

In a mixed dyad each family sends in alternate rounds; the first sender alternates across replicates, so every round averages 3 runs per family (5 runs per round for homogeneous dyads). Rounds where nothing arrived contribute no return proportion.

● Sonnet 4.5 in the mixed dyad
 ● GPT-5 Nano in the mixed dyad
 ● Gemini 3.7 Flash in the mixed dyad
 --- Same family in its homogeneous dyad
